Project Euler #49: Prime permutations

This problem is a programming version of Problem 49 from projecteuler.net

The arithmetic sequence, $1487, 4817, 8147$ in which each of the terms increases by 3330 is unusual in two ways: (i) each of the three terms are prime, and, (ii) each of the 4-digit numbers are permutations of one another.

There are no arithmetic sequences made up of three $1-$, $2-$, or $3-digit$ primes, exhibiting this property.
You are given N and K, find all K size sequences where first element is less than N and K elements are permutations of each other, are prime and are in AP(Arithmetic Progression).

Print the answer as concatenated integer formed by joining K terms.

Input Format
Input contains two integers N and K

Output Format
Print the answer corresponding to the test case. each in new line in numerically sorted order of smallest value.

Constraints
$2000 \le N \le 1000000$
$3 \le K \le 4$

Sample Input

```
2000 3
```

Sample Output

```
148748178147
```
